Cyclone

ONGROUND SILO RANGE
APPLICATION • SPECIFICATIONS • DESIGN
Cyclone is a well-known and trusted name in the rural industry with a proven reputation spanning generations of farmers. All Cyclone Silos are Australian made and manufactured at Jindera NSW by a dedicated team committed to supplying material of the highest quality and workmanship.

Cyclone has been manufacturing silos right here in Australia for over 40 years, allowing farmers greater options in grain marketing. Cyclone silos are manufactured from galvanised high strength sheet steel and hot dipped galvanised accessories, making them strong and durable.

With the increase in extreme weather conditions, Cyclone has re-engineered our silos to offer 1 in 200 year event certification as standard (previously 1 in 100 year).

Cyclone Silos engage a group of experienced grain storage advisors (AgriDealers) who offer advice on the best solution to suit your specific requirements, as well as organise the complete erection and installation of your silo grain storage system.

With the removal of the single desk and grain deregulation, farmers are building more silos to provide increased options for the marketing/selling of their grain.

Increased options include:

- Ability to contract supply
- Blending to maximise price
- Facilitates faster harvest
- Variety segregation
- Choose when to sell
- Maximise transport options
- Insect control
- Moisture management

ONGROUND SILOS

Cyclone on-ground silos are available in a wide range of sizes, from 24 to 48 feet in diameter, and our standard designs are able to store from 218 to 1,743 tonnes of wheat (using a nominal bulk density of 830kg/m³), as well as possessing the unique ability to be upgraded to increase your capacity as your business and storage requirements grow. Cyclone on-ground silos with the ability to store from 2,000 to 5,000 tonnes of grain can be specifically designed and are available on request.

The wide corrugation profile of the galvanised steel walls reduces the risk of internal obstructions, limiting the risk of “hang-ups” which can harbour insects and fungi and lead to grain spoilage or downgrade.

The advanced design and heavier gauge steel sheets at the base mean that Cyclone on-ground silos are strong and stable. This, combined with a specific roof slope, maximises the amount of poured grain that can be stored, making Cyclone silos the obvious choice for your on-ground grain storage needs.
MANUFACTURE AND ERECTION OF CYCLONE SILOS

Silo are manufactured in Jindera NSW by a small dedicated team. We use local subcontractors and mostly Australian steel and materials. Silos are transported as kits around Australia and erected by cyclone Agri Dealers on your site. Agri Dealers will coordinate the addition of customer specific components for loading, ventilation and unloading, and are responsible for the construction of the silo together with determining the location of the silo on your site.

WARRANTY

Cyclone guarantees the silo components it supplies to meet the applicable Australian Standards. However what Cyclone offers is 40 years of continuous service to grain handling. Many Cyclone silos have remained in service well after 25 years of use. Cyclone continues to support farmers with a large range of new on-ground silos and parts needed to update or repair older silos. This commitment to Australia’s grain growers is something Cyclone Australian Made Silos are proud to offer.
CYCLONE SILO DESIGN

Cyclone silos are designed to all applicable Australian Standards for grain load, terrain conditions and wind load. AS3774-1996 describes the grain load condition applying in Australia. Using this standard means Cyclone Silos today are stronger than they ever have been before to the increasing requirements of the standards.

AS1170.2-2011 describes the wind loading requirements for a silo built anywhere in Australia or New Zealand. The team at Cyclone Silos understand the difference site and location has on the wind loading and what the silo must withstand. The standard CA model is designed for installation in a cluster of other silos, in wind region A of Australia, and Importance level 2 meaning suitable to withstand a 1/200 year wind event. If however your requirement is north of the 30 degree South latitude in region B then our stronger CB silo may suit. The CB silo may also suit if your site is on the edge of an escarpment.

Regions are marked with the letters:
A (A1 to A5), B, C, and D. Coastal region boundaries are smooth lines set in from a smoothed coastline by 50, 100, 150 and 200 km. Islands within 50 km of the coast are designated in the same region as the adjacent coast.

AS 1170.2:2011 Figure 3.1 (A). © Standards Australia Limited. Copied by Cyclone Silos with the permission of Standards Australia under Licence 1704-c014.

Note, it is the responsibility of the AgriDealer or contractor constructing the silo at your site to determine if your proposed site is suitable for your silo.

Cyclone can provide a model specific design review statement and certified foundation construction drawings which may be used to support any council DA requirement.

Diameter of Silo (m/ft): 48'/14.6m

*Height does not include concrete foundation, only the silo.
On-farm storage gives you greater control!

- Increased harvest management flexibility
- 24/7 access to your grain
- Insect control
- Variety segregation
- Moisture management

Proudly made and manufactured in Australia!

- Strong galvanised steel construction
- Quality service and support
- Ability to be upgraded to increase capacity
- Well known and trusted reputation
